

Chem*Star Formulations Presents:

Bone Appetit® - Food For Your Bones!

Osteoporosis, or severe bone loss, is a killer condition and in epidemic proportions in our country, responsible for over 1.5 million fractures per year. When women break their hips due to osteoporosis, 15% die in the hospital due to complications from the fracture. That may not sound like a lot, but that's more deaths of women than those who die from cervical cancer, uterine cancer and breast cancer, combined.

As serious as that sounds, the medications used to treat osteoporosis have incredibly bad side effects. Osteonecrosis or death of the jaw bone, esophageal irritation, arrhythmias and recently it has been shown that women who take those drugs, called bisphosphonates, for more than 5 years, begin to suffer broken thigh bones at an alarming rate. We think this is due to the fact that these medications do nothing to build new, strong bone, but only keep old bone around longer. Old bone is much weaker than new bone and eventually, everything comes crashing down. So what can you do to safely re-mineralize your bones?

The nutrients found in our Bone Appetit® formula have been shown to reverse bone loss, the natural way. In the September, 1985 issue of Postgraduate Medical Journal, they found the active ingredient in Bone Appetit® (microcrystalline hydroxyapatite or MCHC) reversed bone loss, even in corticosteroid-treated patients. In a 1984 issue of Current Medical Research Opinion, they reported on a clinical trial where the MCHC treated patients showed a dramatic and significant reduction in pain, due to advanced osteoporosis.

The good news is that you can now add Bone Appetit to your nutritional regimen to help build strong, healthy bones. Magnesium and other trace elements are more important than calcium in reversing bone loss. Check out our entire family of bone-building nutrients!

Bone Appetit® is part of our complete line of bone nutrients, which includes: Magnesium Glycinate, Cal/Mag Balance and Mineral Balance
